

AeroWeather

AeroWeather provides quick and intuitive access to METAR and TAF for airports worldwide. Data can be shown in its original (raw) format or as fully decoded and easy understandable texts. AeroWeather is helpful for weather preflight-briefings, but also to just get very precise weather. All weather data is cached for offline access.

In addition to weather data, AeroWeather Pro integrates also airport NOTAMs, webcam images around airports, and US ATC delay information.

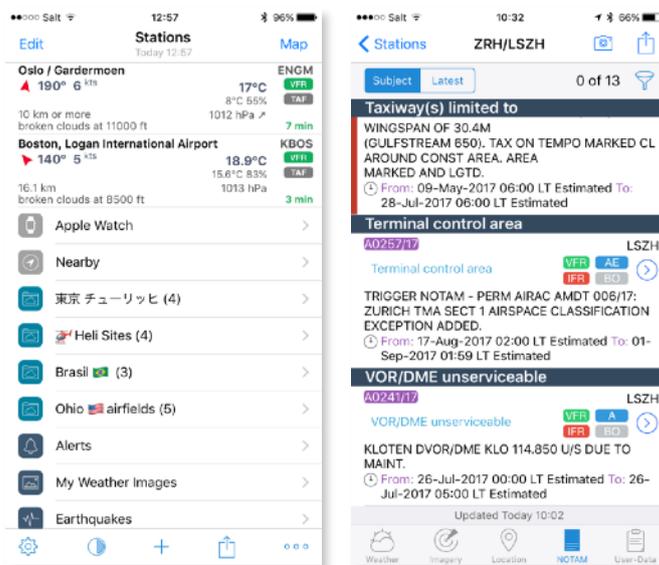

The app features a built-in airport database, which includes basic airport data like runways, sunrise/sunset, twilight times, timezones etc.

The Pro version also shows animated base-reflectivity, velocity, and precipitation radar within detail view (Canadian coverage only).

AeroWeather Pro uses weather data from freely available like US NOAA and FAA services, which cannot be guaranteed. Try out AeroWeather Lite with limited functionality for free first.

Requires iOS 10 or later. Compatible with iPhone, iPad, and iPod touch. Optimised for watchOS 5 plus complication support for various watch faces. Even more functionality (like alerts, meteograms, additional data sources) need to be added as subscription service.

2019/1

Other Aviation Products:

AeroNOTAM gives you easy and fast access to NOTAMs worldwide. It features offline data-management, multiple list views, map view, customizable notifications and filters. Furthermore you can bookmark NOTAMs for later reference and share them by mail, message, or social media sites.

AeroVariation: Calculates the magnetic variation based on the World Magnetic Model (WMM) for any location and year between 2015 and 2019.
